6. Functional Description

6.1 General Description

The F75121 provides VIDIN, VIDOUT function. It can latch the VIDIN from CPU side, and output VIDOUT to PWM. The VIDOUT value can be programmed by the interface GPIO Serial Bus serial interface.

Dedicate GPIO functions. That includes two set watchdog timer. The watchdog timer timeout unit is set to second and range is 0 to 31 seconds. When the timeout has occurred, that will generate a status bit to indicate it and write one will be clear.

All GPIO can be programmed to logic one or zero or high pulse or low pulse.

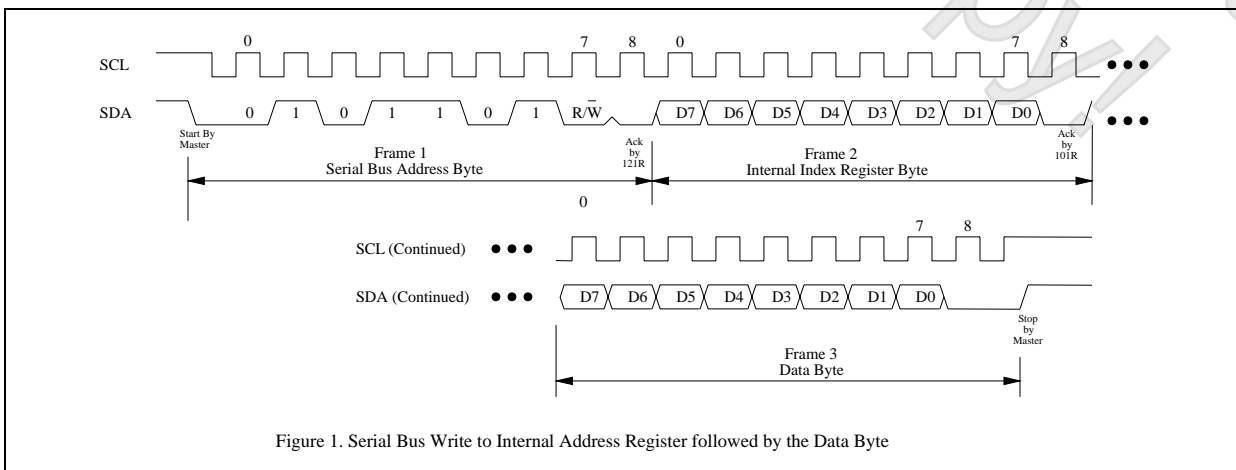

Providing CPU on board detection (SLOT0CC#). The detection circuit is powered by battery. That is latch circuit is powered by VBAT. The de-bounce circuit should be added to avoid low power noise. The de-bounce circuit is generated by internal low frequency clock with 32K Hz to filter out the low-to-high or high-to-low glitch.

6.2 Access Interface

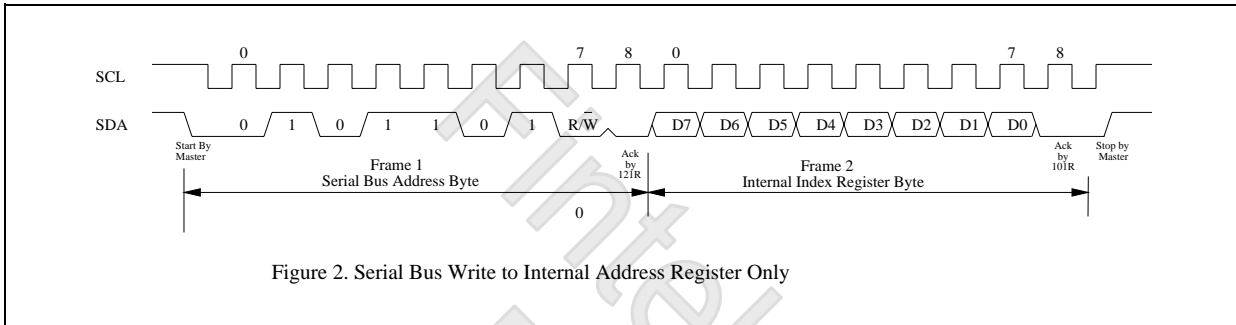

The F75121 provides one serial access interface, Serial Bus, to read/write internal registers. The address of Serial Bus is configurable by using power-on trapping of standby power VBS3V. The pin 11 (GPIO11/I2C_ADDR) is multi-function pin. During the VSB 3V power-on, this pin serves as input detection of logic high or logic low. This pin is default pull-down resistor with 100K ohms mapping the Serial Bus address 0x9C (1001_1100). Another Serial Bus address 0x6E (0110_1110) is set when external pull-up resistor with 10K ohms is connected in this pin.

6.3 The SMBus access timing are shown as follow:

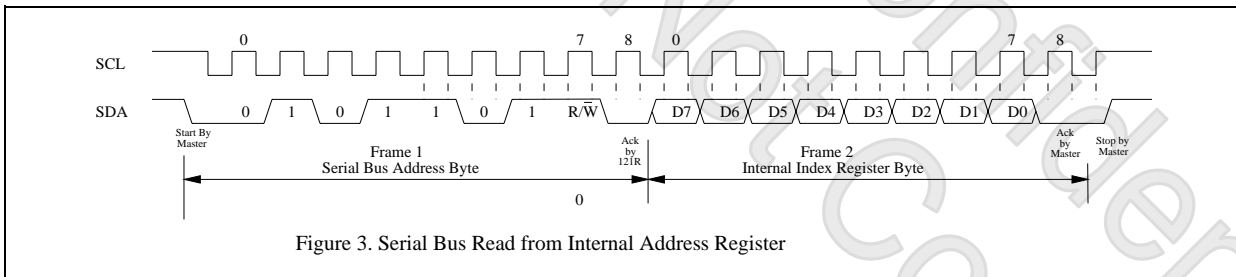

(a) SMBus write to internal address register followed by the data byte

(b) Serial bus write to internal address register only

(c) Serial bus read from a register with the internal address register prefer to desired location

6.4 VID Function

Please refer to control registers.

6.5 GPIO Function

The GPIO functions in the F75121 include general GPIO with programming Input and output. The output function also can be programmed high level or low level or high pulse or low pulse.

CPU Voltage ID (VID) function

The F75121 provides a voltage adjustment in the CPU with VID control. In general, the VIDIN is connected to CPU VID<4:0>(VRM9.X) or VID<5:0>(VRM10.0) and VIDOUT is connected to PWM Vcore VID. In the first power-on, the VIDIN is bypassed to VIDOUT.

6.5.1 General GPIO Function

Please refer to control registers.

6.5.3 Reset Out (RSTOUT) Function

Please refer to control registers.

6..4 Watchdog Function

Please refer to control register.
