

## DUAL HALF BRIDGE DRIVER

- HALF BRIDGE OUTPUTS WITH TYPICAL  $R_{ON} = 0.7\Omega$
- OUTPUT CURRENT CAPABILITY  $\pm 1.2A$
- OPERATING SUPPLY VOLTAGE RANGE 7V TO 16.5V
- SUPPLY OVERVOLTAGE PROTECTION FUNCTION FOR  $V_{VS}$  UP TO 40V
- VERY LOW QUIESCENT CURRENT IN STANDBY MODE  $< 1\mu A$
- CMOS COMPATIBLE INPUTS WITH HYSTERESIS
- OUTPUT SHORT-CIRCUIT PROTECTION
- THERMAL SHUTDOWN
- REAL TIME DIAGNOSTIC: THERMAL OVERLOAD, OVERVOLTAGE

### MULTIPOWER BCD TECHNOLOGY

SO20 (12+4+4)

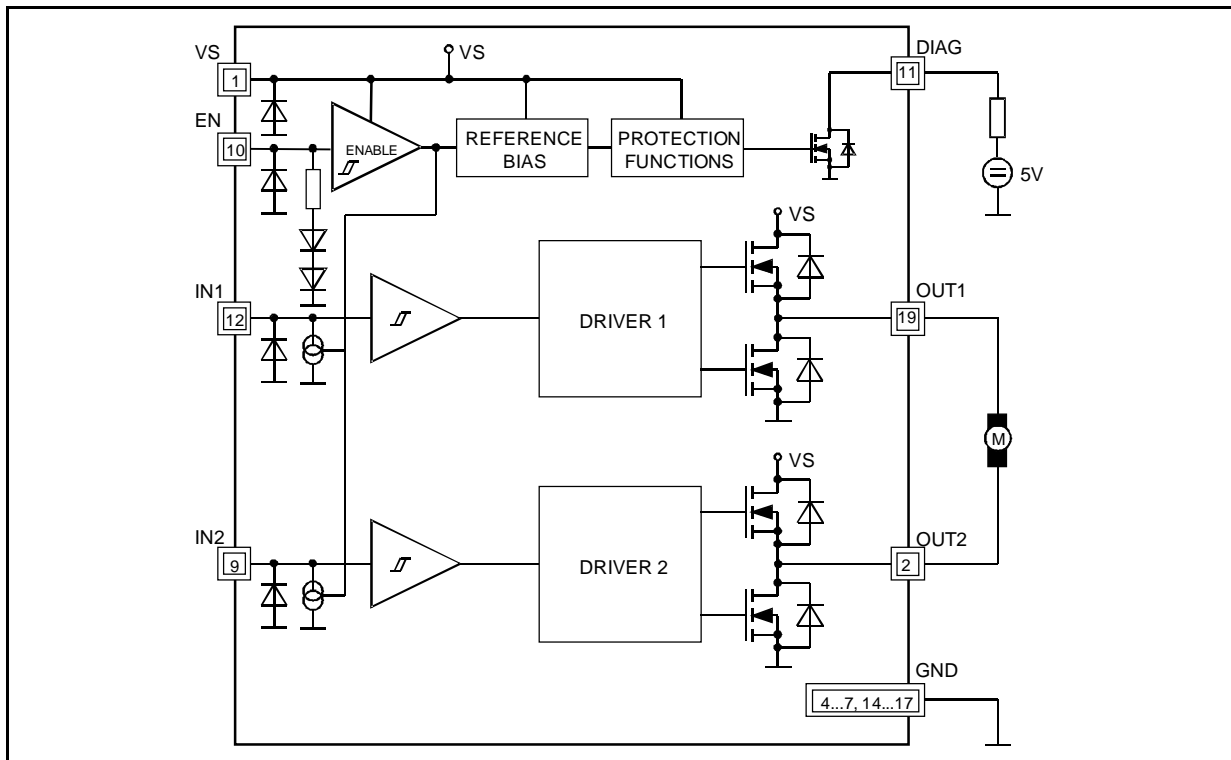

ORDERING NUMBERS: L9997ND  
L9997ND013TR

### DESCRIPTION

The L9997ND is a monolithic integrated driver, in BCD technology intended to drive various loads,

including DC motors. The circuit is optimized for automotive electronics environmental conditions.

### BLOCK DIAGRAM

## L9997ND

### ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
$V_{VSDC}$	DC Supply Voltage	-0.3 to 26	V
$V_{VSP}$	Supply Voltage Pulse (T < 400ms)	40	V
$I_{OUT}$	DC Output Current	$\pm 1.8$	A
$V_{IN1,2}$	DC Input Voltage	-0.3 to 7	V
$V_{EN}$	Enable Input Voltage	-0.3 to 7	V
$V_{DIAG}$	DC Output Voltage	-0.3 to 7	V
$I_{OUT}$	DC Output Short-circuit Current $-0.3V < V_{OUT} < V_S + 0.3V$	internally limited	
$I_{DIAG}$	DC Sink Current $-0.3V < V_{DG} < 7V$	internally limited	

### PIN CONNECTION (Top view)

### PIN FUNCTIONS

N.	Name	Function
1	VS	Supply Voltage
2	OUT2	Channel 2: Push-Pull power output with intrinsic body diode
3, 8, 13, 18, 20	NC	NC: Not Connected
4 to 7, 14 to 17	GND	Ground: signal - and power - ground, heat sink
9	IN2	Input 2: Schmitt Trigger input with hysteresis (non-inverting signal control)
10	EN	Enable: LOW or not connected on this input switches the device into standby mode and the outputs into tristate
11	DIAG	Diagnostic: Open Drain Output that switches LOW if overvoltage or overtemperature is detected
12	IN1	Input 1: Schmitt Trigger input with hysteresis (non-inverting signal control)

### THERMAL DATA

Symbol	Parameter	Value	Unit
$T_{jTS}$	Thermal Shut-down Junction Temperature	165	$^{\circ}C$
$T_{jTSH}$	Thermal Shut-down Threshold Hysteresis	25	K
$R_{th j-amb}$	Thermal Resistance Junction-Ambient <sup>(1)</sup>	50	K/W
$R_{th j-pins}$	Thermal Resistance Junction-Pins	15	K/W

(1) With 6cm<sup>2</sup> on board heatsink area.

**ELECTRICAL CHARACTERISTICS** ( $7V < V_S < 16.5V$ ;  $-40^{\circ}C < T_J < 150^{\circ}C$ ; unless otherwise specified.)

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit

$t_{fHS}$	Fall Time			25	100	$\mu s$
$t_{fLS}$				50	150	$\mu s$

\* Tested at  $125^{\circ}C$  and guaranteed by correlation**FUNCTIONAL DESCRIPTION**

The L9997ND is a motor driver two half-bridge

outputs, intended for driving dc motors in automotive systems. The basic function of the device is shown in the Table 1.

**Table 1. Table function.**

Status	EN	IN1	IN2	OUT1	OUT2	DIAG	NOTE
1	L	X	X	Tristate	Tristate	OFF	Standby Mode
2	H	H	H	SRC	SRC	OFF	Recommended for braking
3	H	H	L	SRC	SNK	OFF	
4	H	L	H	SNK	SRC	OFF	
5	H	L	L	SNK	SNK	OFF	
6	H	X	X	Tristate	Tristate	ON	Overvoltage or Overtemperature

The device is activated with enable input voltage HIGH. For enable input floating (not connected) or LOW the device is in Standby Mode. Very low quiescent current is defined for  $V_{EN} < 0.3V$ . When activating or deactivating the device by the enable input a wake-up time of  $50\mu s$  is recommended.

For braking of the motor the status 2 is recommended. The reason for this recommendation is that the device features higher threshold for initialisation of parasitic structures than in state 5.

The inputs IN1, IN2 features internal sink current generators of  $10\mu A$ , disabled in standby mode. With these input current generators the input level is forced to LOW for inputs open. In this condition the outputs are in SNK state.

The circuit features an overvoltage disable function referred to the supply voltage  $V_{VS}$ . This function assures disabling the power outputs, when the supply voltage exceeds the over voltage threshold value of  $19V$  typ. Both outputs are forced to tristate in this condition and the diagnostic output is ON.

The thermal shut-down disables the outputs (tristate) and activates the diagnostic when the junction temperature increases above the thermal shut-down threshold temperature of min.  $150^{\circ}C$ . For the start of a heavy loaded motor, if the motor current reaches the max. value, it is necessary to respect the dynamical thermal resistance junction to ambient. The outputs OUT1 and OUT2 are protected against short circuit to GND or  $V_S$ , for supply voltages up to the overvoltage disable threshold.

The output power DMOS transistors works in linear mode for an output current less than  $1.2A$ . Increasing the output load current ( $> 1.2A$ ) the out-

put transistor changes in the current regulation mode, see Fig.6, with the typical output current value below  $2A$ . The SRC output power DMOS transistors requires a voltage drop  $\sim 3V$  to activate the current regulation. Below this voltage drop is the device also protected. The output current heat up the power DMOS transistor, the  $R_{DS(ON)}$  increases with the junction temperature and decreases the output current. The power dissipation in this condition can activate the thermal shut-down. In the case of output disable due to thermal overload the output remains disabled until the junction temperature decreases under the thermal enable threshold.

Permanent short circuit condition with power dissipation leading to chip overheating and activation of the thermal shut-down leads to the thermal oscillation. The junction temperature difference between the switch ON and OFF points is the thermal hysteresis of the thermal protection. This hysteresis together with the thermal impedance and ambient temperature determines the frequency of this thermal oscillation, its typical values are in the range of  $10kHz$ .

The open drain diagnostic output needs an external pull-up resistor to a  $5V$  supply. In systems with several L9997ND the diagnostic outputs can be connected together with a common pull-up resistor. The DIAG output current is internally limited.

Fig. 1 shows a typical application diagram for the DC motor driving. To assure the safety of the circuit in the reverse battery condition a reverse protection diode  $D_1$  is necessary. The transient protection diode  $D_2$  must assure that the maximal supply voltage  $V_{VS}$  during the transients at the  $V_{BAT}$  line will be limited to a value lower than the absolute maximum rating for  $V_{VS}$ .
